

**Figure 1** illustrates the study design, participant flow, and the distribution of participants across various demographic and clinical variables.

**Study Design:** The study involved 1000 participants. 500 participants completed the study, while 500 were lost to follow-up.

**Participant Flow:** The flowchart shows the progression from recruitment to completion. 1000 participants were recruited, 500 completed the study, and 500 were lost to follow-up.

**Demographic and Clinical Variables:** The bar charts show the distribution of participants across various variables, including age, sex, education, income, and clinical outcomes.

**Age Distribution:** The distribution of participants by age group is shown in the first bar chart. The x-axis represents age groups (e.g., 18-24, 25-34, etc.), and the y-axis represents the number of participants.

**Sex Distribution:** The distribution of participants by sex (Male and Female) is shown in the second bar chart.

**Education Distribution:** The distribution of participants by education level (e.g., High School, College, etc.) is shown in the third bar chart.

**Income Distribution:** The distribution of participants by income level (e.g., Low, Medium, High) is shown in the fourth bar chart.

**Clinical Outcomes:** The distribution of participants by clinical outcomes (e.g., Remission, No Remission) is shown in the fifth bar chart.
